ANDON DISPLAY BOARDS

We are pleased to introduce our indigenously developed Display Systems. This display system is a multi parameter system useful for all manufacturing facilities. It provides bright and clear indcation of process parameters which helps in enhancing production efficiency.

The Display system is composed of LED matrix. The size can be customized as per customer requirement. The LED matrix can display alphanumeric characters as compared to conventional 7 segment LED displays, making it very user friendly and easy to read. The super bright LED's are bright enough to be mounted outdoors. The display can easily be viewed from upto 300 meter. The construction of the display is such that it can be mounted outdoors directly.

The display can be directly connected to sensors, 4 to 20 mA transmitter outputs, or it can take data from serial port of PLC/ DCS using Modbus RTU protocol.

Additional key feature is that these devices can be IOT enabled. Thus data can be acquired from cloud, or data can be sent to the cloud, from where it can be viewed remotely also.
